Responsive:
For having a good website and usable pages in any kind of system, we have to use some different kind of code in programming and it can become usable every where like mobile,tablet and different size of screen and its important to do that because in this generation there are a lot kind of system that they are with different screen size like mobile or any mobility service .

to having responsive in code i use some how in HTML like choosing different Meta tag that i used to change view port and CSS code for first mobile side and then the other that they have bigger screen,i used Media Query and Flex box like a style in CSS and style it to how can be if it become small or big.

 I use mobile ability in all part of my pages but of course more in top and down (Header and Footer) of pages.

I use it for Pictures and Text and ingredient of pages,it means i use it where ever it need to be used and they will be have different Size and View.

SEO:
(Search engine optimization) is one of important part of page that every Web site have to include in some kind of different part of page to have high ranking for Search in all Search engine that every Web site have to include in some different way and code inside of their pages .

for example in the beginning of my Web site i use Keyword in meta   tag because its good for SEO (Search engine optimization).of course i try to   write as good as possible and its in order and nice i think in both part of coding in HTML and CSS . I use to do user friendly , many different word   that they are related to the web site to make it more and more usable.I use <H1> tags that they are visible in every page of site.some links that they related to web site too that they are available in the pages.
